Challenge 2: Data Card

Transparency regarding the datasets used to train or fine-tune models is essential for responsible AI. Please detail the origins, composition, and limitations of your primary dataset.

Dataset Metadata

Dataset Name	AgriClimate-Africa-SLM-Corpus
Source / Creator	Open-source FAO data, regional weather stations, and partner cooperatives
License	CC-BY 4.0
Data Modality	Text (Agricultural Q&A, weather summaries) and Tabular (yield histories)
Total Size	Approx. 25,000 text samples, 1.2GB

1. Provenance & Collection

How was this data collected? Was it scraped, crowdsourced, or generated? Were the creators compensated or aware of this use?

The data was aggregated from publicly available government meteorological APIs and open agricultural databases. Additionally, conversational Q&A pairs were ethically crowdsourced from extension workers who were compensated fairly for their domain expertise.

2. Demographics & Representation

Does the data accurately represent the target population? Are there known over-represented or under-represented groups (e.g., geographic bias, language dialects)?

The dataset strongly represents staple crops (maize, sorghum, cassava) in East and Southern Africa. However, it currently over-represents English and Swahili, meaning minority local dialects are under-represented. Geographic data is also sparser in highly remote regions without digital weather stations.

3. Known Limitations & Anomalies
