Challenge 4: Stakeholder Engagement Plan

AI tools should not be built in isolation. Design a mini-engagement plan to involve communities, domain experts, and end-users in your development cycle to ensure the solution is relevant and ethical.

Stakeholder Mapping

Stakeholder Group	Role / Interest in Project	Engagement Method
Agronomists & Climate Scientists	Validating climate-resilient crop recommendations and soil models	Bi-weekly technical review sessions & 1-on-1 interviews
Smallholder Farmers (End Users)	Usability, SMS-based interface accessibility, and trust in AI advice	Field testing with interactive voice/SMS prototypes
Local Agricultural Cooperatives	Mitigating economic harm from incorrect yield predictions	Monthly focus groups and town hall demonstrations

Feedback Integration Timeline

How and when will you incorporate the feedback gathered into your model training or UI development?

- **Phase 1 (Design):** Conduct initial scoping interviews with agronomists to define key climate variables and source locally relevant crop data.
- **Phase 2 (Training):** A/B test model outputs with cooperative leaders; adjust the model's confidence thresholds based on their feedback regarding risk tolerance.
- **Phase 3 (Evaluation):** Broad beta rollout to 50 farmers; conduct a survey on advice accuracy and ease of use to refine final model weights and UI prompts.
